

SQ, SQE, SP

Stainless steel submersible pumps and accessories
60 Hz

Mission

- to successfully develop, produce, and sell high quality pumps and pumping systems worldwide, contributing to a better quality of life and healthier environment

Bjerringbro, Denmark

Fresno, California

Olathe, Kansas

Monterrey, Mexico

Allentown, Pennsylvania

Oakville, Ontario

- One of the 3 largest pump companies in the world with over 11,000 employees worldwide
- World headquarters in Denmark
- North American headquarters in Kansas City - Manufacturing in Fresno, California
- 60 companies in 40 countries
- More than 10 million pumps produced annually worldwide
- North American companies operating in USA, Canada and Mexico
- Continuous reinvestment in growth and development enables the company to **BE** responsible, **THINK** ahead, and **INNOVATE**

GRUNDFOS STAINLESS STEEL PUMPS

STAINLESS STEEL CONSTRUCTION

Grundfos submersibles feature rugged and durable stainless steel construction for all vital pump components. Impellers, diffusers, shafts, vanes, cable guards, couplings...even the nuts and bolts are stainless steel. Grundfos' 4-inch pump systems include the stainless steel pump, motor, and control box and are delivered ready to install.

Computer-aided design and manufacturing techniques ensure that each *pump* is built to exacting tolerance and performs to industry-leading standards. Grundfos state-of-the-art production equipment includes extensive use of robotics and advanced quality assurance procedures. You can rely on quality Grundfos' groundwater products for outstanding pump performance and best value.

SUBMERSIBLES

4-INCH and LARGER WELLS

The 4-inch submersibles line covers all flow requirements from 1.2 to 95 gpm and heads to 2000 feet. This broad range ensures proper pump selection for all domestic groundwater system applications.

6, 8, & 10-INCH and LARGER WELLS

For high flow requirements, this submersible line includes 6, 8, and 10-inch models for flows up to 1,400 gpm and heads to 2100 feet.

Grundfos offers 18 models of submersible pumps designed for domestic and industrial applications with flow rates from five to 1,400 gpm. Horsepower range extends from 1/3 hp to 250 hp. These pumps are marketed through more than 300 distributors and nearly 2,000 dealers nationwide.

THE STAINLESS STEEL ADVANTAGE

TOP PUMP PERFORMANCE

Grundfos pumps are built to work hard with every component designed for maximum hydraulic efficiency. With the inherently smooth surfaces of fabricated stainless steel, peak performance is maintained over many years of service.

RELIABLE OPERATION

Highly advanced design and manufacturing techniques minimize the number of moving parts. This, plus Grundfos' use of rugged stainless steel construction, make GRUNDFOS groundwater pumps the toughest, most reliable pumps on the market. With Grundfos you can rely on getting the water you need, when you need it.

LONG PUMP LIFE

Stainless steel is the best available material to resist wear and corrosion in water system applications. Compare Grundfos' stainless steel construction to the best the other manufactures have to offer. Grundfos stainless steel pumps are designed to operate efficiently and effectively for a long, long time.

SQ/SQE SUBMERSIBLE PUMPS

3-Inch SQ/SQE Submersible Well Pumps 3-Inch and Larger Wells

SQ/SQE pumps are suitable for both continuous and intermittent operation for a variety of applications:

- Domestic water supply
- Small waterworks
- Irrigation
- Tank applications

SQ, SQE pumps offer the following features:

- Dry-Run protection
- High efficiency pump and motor
- Protection against up-thrust
- Soft-start
- Over-voltage and under-voltage protection
- Overload protection
- Over-temperature protection
- High starting torque

Additionally, the SQE pumps offer:

- Constant pressure control
- Variable speed
- Electronic control and communication

The SQ and SQE pump models incorporate an innovative motor design. With the use of permanent-magnet technology within the motor, the SQ/SQE pumps deliver unmatched performance. By combining permanent-magnet motors and Grundfos's own micro frequency converter, we are now able to control and communicate with the pump in ways never before possible. A few of the features that

come out of this combination are Constant Pressure Control, Soft-Start, and integrated Dry-Run protection. These are just a few of the many features that the SQ/SQE pumps can offer.

The SQ pump models operate at a constant speed much like today's conventional pumps. The difference between it and traditional pumps is you get all the benefits of an electronically controlled permanent-magnet motor that cannot be accomplished with a conventional induction motor. The SQ pumps are available for single phase power. They use a simple 2-wire design making installation easy.

The SQE uses the Grundfos "Smart Motor". Like the SQ model, we still use the high efficiency permanent magnet motor, but we give this motor the ability to communicate. The "Smart Motor" communicates via the CU301 status box through the power leads. It is not necessary to run any additional wires down the well. By being able to communicate with the pump you can have Constant Pressure Control and the ability to change the pump performance while the pump is installed in the well. Like the SQ motor, this is also a 2-wire motor designed for single-phase operation.

Step 1

Calculate minimum head requirements at no flow conditions:

H_{max} (required) = dynamic head + system pressure (in feet) + above grade elevation + friction loss.

Step 2

Select pump from chart as follows:

- Choose model family based on the desired flow rate. i.e. 15SQE for a flow rate of 15gpm
 - Select the first model with a value in Column 2 greater than the H_{max} calculated in Step 1
 - For example: the choice for a 22gpm model with an H_{max} of 140' would be the 22SQE-160.
- Double check your selection in the performance curves found in the previous pages of this book.

Step 1

Calculate maximum head requirements at rated flow conditions:

$$H_{max} = \text{dynamic head} + \text{system psi (in feet)} + \text{friction loss} + \text{above grade elevation}$$

Step 2

Select pump from chart as follows:

- ▶ Select a model in which the calculated value of Hmax is below the value in column 2
- ▶ For example: the choice for a 40gpm model with an Hmax of 150 would be the 40S30-9

0.75 [Hp]	20.9" length x 2.68 diameter
1.0 - 1.5 [Hp]	22.3" length x 2.68 diameter
Motor Weights (MS3 & MSE3)	
0.50 [Hp]	6.0 lbs
0.75 [Hp]	7.1 lbs
1.0 - 1.5 [Hp]	8.2 lbs
Pump End Dimensions:	
Pump Diameter:	2.68
Pump Diameter, incl cable guard	2.91
Pump End Dimensions (min. and max.):	
5SQ/SQE	10.6" to 18.0"
10SQ/SQE	10.6" to 14.8"
15SQ/SQE	10.6" to 16.9"
22SQ/SQE	10.6" to 13.7"
30SQ/SQE	10.6" to 13.7"
Pump End Weights (min. and max.):	
All SQ/SQE Models	2.2 lbs to 3.5 lbs
Well Diameter:	3-inch or larger
Installation Depth (maximum)	500 feet below static water level

Fig. A

Fig. B

NOTES: All models suitable for use in 6" wells, unless equipped with 8" motor.

Weights include pump end with motor in lbs.

* Alternate motor sizes available.

** Built into sleeve, 4" NPT, 8" motor required.

MATERIALS OF CONSTRUCTION

COMPONENT	CYLINDRICAL SHAFT (2-18 Stgs.)
Check Valve Housing	304 Stainless Steel
Check Valve	304 Stainless Steel
Diffuser Chamber	304 Stainless Steel
Split Cone Nut	304 Stainless Steel
Split Cone	304 Stainless Steel
Impeller	304 Stainless Steel
Suction Interconnector	304 Stainless Steel
Inlet Screen	304 Stainless Steel
Straps	304 Stainless Steel
Cable Guard	304 Stainless Steel
Coupling	316/329 Stainless Steel**
Pump Shaft	431 Stainless Steel
Intermediate Bearings	NBR
Impeller Seal Ring	NBR/304 Stainless Steel
Check Valve Seat	NBR/316 Stainless Steel
Top/Lower Bearing	NBR/316 Stainless Steel
8" Motor Adaptor Plate	304 Stainless Steel
Upthrust Washer	Carbon/Graphite HY22
Upthrust stop ring	304 S.S./Tungsten Carbide
Sleeve*	304 Stainless Steel
Sleeve Flange*	304 Stainless Steel

NOTES: Specifications subject to change without notice.
 * Required for 20-22 stage only.
 ** 4" Coupling made of 316 Stainless Steel.

FLOW RANGE: 160 -320 GPM

OUTLET SIZE: 3" NPT

NOMINAL DIA. 6"

SPECIFICATIONS SUBJECT TO CHANGE WITHOUT NOTICE.
 4" MOTOR STANDARD, 7.5 HP/3450 RPM
 6" MOTOR STANDARD, 10-60 HP/3450 RPM.
 8" MOTOR STANDARD, 75 HP/3525 RPM.
 * Alternate motor sizes available.

Performance conforms to ISO 9906 Annex A
 @ 8 ft. min. submergence.

FLOW RANGE: 160 -320 GPM

OUTLET SIZE: 3" NPT

NOMINAL DIA. 6"

SPECIFICATIONS SUBJECT TO CHANGE WITHOUT NOTICE.

CONTROL BOX SA-SPM5

**Enclosure**

NEMA Type 3R rated suitable for outdoor mounting provided with mounting holes, progressive knockouts, and hinged door. 18 gauge steel construction with a gray colored epoxy coating provides great mechanical properties and corrosion protection.

Product Range

Provided in 115 VAC, 60 Hz, Single-phase for 1/3 HP and 1/2 HP motors.

Provided in 230 VAC, 60 Hz, single-phase for 1/3 HP, to 5 HP motors.

Internal wiring

Internal wire is 14 AWG, THHN, 105 degrees C, 600 VAC rated insulation.

Voltage relay

UL Recognized General Electric™ voltage relay.

Start capacitor

User friendly quick disconnect brackets for UL Recognized Mallory™ start capacitor.

Pull handle disconnect

The pull handle disconnect is available to break voltage between line/service voltage and the starting components and motor leads.

G111 & G231 PumpSaver

The **Model G111** fits inside 1/3 and 1/2 Hp 115V control boxes.

Model G231 fits inside 1/3, 1/2, 3/4, and 1 Hp 230V control boxes. The PumpSaver Model G111/231 is a current monitor designed to protect single phase pumps from dry well, dead head, jammed impeller, and over & under voltage conditions. Typical applications include residential waterwells, commercial water wells, irrigation wells, and golf course systems.

Features and benefits:

- Restart delay can be set up to 225 minutes or placed in manual reset mode.
- Can be calibrated to specific pump/motor combinations and various conditions.
- “Run Light” conveniently shows that the unit is functional.
- Fits in existing Grundfos control box – saving enclosure costs.
- Quick easy installation.

Made for pumps by pump experts

Simple set-up a priority

Simple installation and set-up was a major priority for the MP 204 designers. Mounting is done by means of four screws or by sliding the unit onto a mounting rail, and the entire set-up can be completed in just two minutes. The simple menu is used to set four parameters: rated motor amps, nominal voltage, trip class, and no. of motor phases. After just 120 seconds of setting, the unit is ready to go.

Technical data – MP 204

• Enclosure class:	NEMA 1 (IP 20)
• Ambient temperature:	-4°F to 140°F (-20°C to 60°C)
• Relative humidity:	99%
• Voltage range:	80-610VAC
• Current range:	3-999A
• Frequency:	47 – 63 Hz
• IEC trip class:	1 – 45
• Special Grundfos trip class:	0.1 – 30 s
• Voltage variations:	-25/+15% of nominal voltage
• Approvals:	EN 60947, EN 60355, UL/CSA 508
• Marking:	SE, cUL, C-tick

* For currents above 120A, external transformers required

Electronic pump protection made simple

Submersible motors are made to be very strong indeed. But that does not mean they cannot benefit from extra protection that prolongs their lifetime and safeguards them against external threats. That is why we created the new MP 204 motor protection unit. Made especially for pump motors by pump specialists, it was designed to bring you protection that is as simple to use as it is efficient. Our engineers crammed it full of all the protection features you need – but kept it easy to install, set, and use.

Protect your motors against external threats

The MP 204 protects pump motors against undervoltage, overvoltage and other variations in power supply. So even if your external power supply is not entirely steady, your SP pump will remain as reliable as ever. Very importantly, the extra protection also reduces wear, thereby prolonging the motor’s lifespan. Reduced power consumption is a strong indication that the pump is about to run dry, so the MP 204 will immediately stop the pump if the well goes dry.

Access more functions with the R 100 remote control

R 100 remote

The R 100 remote control from Grundfos gives you access to even more options. For example, you can adjust factory settings, carry out service and troubleshooting, and get read-outs of data stored in the MP 204 unit.

Monitoring parameters

• Insulation resistance before start-up
• Temperature (Tempcon, PT sensor and PTC/thermal switch)
• Overload / underload
• Overvoltage / undervoltage
• Phase sequence
• Phase missing
• Power factor (cos φ)
• Power consumption
• Harmonic distortion
• Current asymmetry
• Run and start capacitor (single-phase)
• Operating hours and number of starts

Part 1 – INTRODUCTION

Part 2 – CABLE SELECTION

Part 3 – MISC. TECHNICAL DATA, FORMULAS, AND CONVERSIONS

PART 1: INTRODUCTION

General

This section will provide the technical information needed to properly select GRUNDFOS groundwater products. The information applies primarily to domestic groundwater systems using 4-inch wells with submersible or jet pumps, pressure tanks, and accessories. It is important to be familiar with typical system components and their basic hydraulic principles to ensure a better understanding of the more technical information found later in this section.

Prior to selecting the pump, the basic system requirements must be determined. System capacity and system pressure must be calculated and friction losses determined to ensure proper system performance. These calculations are covered in detail in **Part 1**. In **Part 2**, information is provided on proper cable selection. Also provided in **Part 3** are miscellaneous technical data and formulas commonly used in the selection of domestic groundwater systems.

Typical System Components

Domestic groundwater systems are made up of a pump, storage tank, and accessories to operate the system automatically. Pumps are generally of the submersible or jet variety and include the pump and motor as a unit. Refer to Figure 8-A for the components found in a typical automatic groundwater pumping system.

In a **closed, automatic water system** a pressure tank is used to store water and maintain system pressure between specified limits (such as 30 to 50 psi). As the water level in the tank rises, tank air is compressed in the upper part of the tank until the upper pressure limit is reached (i.e., 50 psi). At this “cut-out” point a pressure switch opens the electrical circuit to the motor and the pump stops.

The compressed air in the tank acts like a spring pushing down on the water to create system pressure. When a valve is opened in the water system, the air pressure in the upper part of the tank forces the water to flow out of the tank and into the system. As the water is drawn from the tank, the air occupies a larger space and the pressure drops until the lower limit is reached (i.e., 30 psi). At this “cut-in” point the pressure switch closes the electrical circuit to the motor and the pump starts. A cycle is thereby completed.

FIGURE 8-A

Components found in a typical automatic groundwater pumping system including a submersible pump, pressure tank, and pressure control accessories.

In an **open, automatic water system** the pump is used to fill a large, elevated storage tank which utilizes gravity to maintain system pressure. Tank level controls are used to cycle the pump to maintain water levels within prescribed limits.

Refer to the following illustrations for schematic layouts of typical domestic groundwater systems and components: Figure 8-B (Submersible Pump - Closed System), Figure 8-C (Submersible Pump - Open System), Figure 8-D (Shallow Well Jet Pump), and Figure 8-E (Deep Well Jet Pump).

FIGURE 8-B
Figure 8-B illustrates a schematic layout of a CLOSED groundwater pumping system using a submersible pump and pressure tank set for automatic operation. A pressure switch controls the cycling of the pump.

Closed Groundwater System with Submersible Pump

- A. STATIC WATER LEVEL (in feet):** vertical distance from the top of the well to the standing water level or water table.
- B. DRAWDOWN (in feet):** reduction in the water level during pumping (varies with well yield and pump capacity).
- C. PUMPING WATER LEVEL or LIFT (in feet):** $C = A + B$.
- D. FRICTION LOSSES in the WELL (in feet):** friction losses caused by the drop pipe and fittings between the pump and the top of the well.
- E. TOTAL LIFT in the WELL (in feet):** $E = A + B + D$.
- F. STATIC DISCHARGE HEAD (in feet):** for PRESSURE TANK SYSTEMS it is the elevation rise in feet of the pressure tank, discharge nozzles, etc., above the top of the well plus the pressure (in feet) required at that level.
- G. FRICTION LOSSES in the DISCHARGE SYSTEM (in feet):** friction losses caused by piping, valves, and fittings between the top of the well and the point of discharge.
- H. TOTAL DISCHARGE HEAD (in feet):** $H = F + G$.
- J. TOTAL PUMPING HEAD (in feet):** $J = E + H$.
- K. SETTING OF PUMP (in feet):** vertical distance from the top of the well to the top of the pump.
- L. OVERALL LENGTH (in feet):** vertical distance from the top of the well to the bottom of the pump.
- M. SUBMERGENCE (in feet):** $M = K - C$.
- Q. CAPACITY (in gpm or gph):** rate of pumping.

FIGURE 8-C
Figure 8-C illustrates a schematic layout of an OPEN groundwater pumping system using a submersible pump and an elevated storage tank set for automatic operation. A level control on the storage tank controls the cycling of the pump.

Open Groundwater System with Submersible Pump

- A. STATIC WATER LEVEL (in feet):** vertical distance from the top of the well to the standing water level or water table.
- B. DRAWDOWN (in feet):** reduction in the water level during pumping (varies with well yield and pump capacity).
- C. PUMPING WATER LEVEL or LIFT (in feet):** $C = A + B$.
- D. FRICTION LOSSES in the WELL (in feet):** friction losses caused by the drop pipe and fittings between the pump and the top of the well.
- E. TOTAL LIFT in the WELL (in feet):** $E = A + B + D$.
- F. STATIC DISCHARGE HEAD (in feet):** for OPEN DISCHARGE SYSTEMS it is the elevation of the highest water level above the top of the well.
- G. FRICTION LOSSES in the DISCHARGE SYSTEM (in feet):** friction losses caused by piping, valves, and fittings between the top of the well and the point of discharge.
- H. TOTAL DISCHARGE HEAD (in feet):** $H = F + G$.
- J. TOTAL PUMPING HEAD (in feet):** $J = E + H$.
- K. SETTING OF PUMP (in feet):** vertical distance from the top of the well to the top of the pump.
- L. OVERALL LENGTH (in feet):** vertical distance from the top of the well to the bottom of the pump.
- M. SUBMERGENCE (in feet):** $M = K - C$.
- Q. CAPACITY (in gpm or gph):** rate of pumping.

FIGURE 8-D
Figure 8-D illustrates a schematic layout of a SHALLOW WELL groundwater pumping system using a shallow well JET PUMP designed for setting to 25 feet. The pressure tank is set for automatic operation with a pressure switch controlling the cycling of the pump.

FIGURE 8-E
Figure 8-E illustrates a schematic layout of an DEEP WELL groundwater pumping system using a deep well JET PUMP designed for settings to 100 feet. The pressure tank is set for automatic operation with a pressure switch controlling the cycling of the pump.

CLOSED GROUNDWATER SYSTEM WITH SHALLOW WELL JET PUMP

- A. Static Water Level (in feet):** vertical distance from the top of the well to the standing water level or water table.
- B. Drawdown (in feet):** reduction in the water level during pumping (varies with well yield and pump capacity).
- C. Pumping Water Level or Lift (in feet):** $C = A + B$.
- D. Friction Losses in the Suction System (in feet):** friction losses caused by suction piping between the pump and foot valve.
- E. Total Suction Lift (in feet):** $E = A + B + D + I$.
- F. Static Discharge Head (in feet):** for *Pressure Tanks Systems* it is the elevation rise in feet of the pressure tank, discharge nozzles, etc., above the pump plus the pressure (in feet) discharge nozzles, etc., above the pump plus the pressure (in feet) required at that level. For *Open Discharge Systems* it is the elevation in feet of the highest water level above the pump.
- G. Friction Losses in the Discharge System (in feet):** friction losses caused by piping, valves, and fittings between the top of the well and the point of discharge.
- H. Total Discharge Head (in feet):** $H = F + G$.
- I. Elevation of the Pump above the Top of the Well (in feet).**
- J. Total Pumping Head (in feet):** $J = E + H$.
- K. Setting of the Foot Valve or Strainer (in feet):** vertical distance from the top of the well to the top of the foot valve or strainer.
- L. Overall Length (in feet):** vertical distance from the top of the well to the bottom of the foot valve or strainer.
- M. Submergence (in feet):** $M = K - C$.
- Q. Capacity (in gpm or gph):** rate of pumping.

- L. Overall Length (in feet):** vertical distance from the top of the well to the bottom of the foot valve or strainer.
- M. Submergence (in feet):** $M = K - C$. The ejector should be set as close to the bottom of its maximum depth rating as the well will permit.
- Q. Capacity (in gpm or gph):** rate of pumping.

Head and Pressure

Head and pressure are related in a very simple and direct manner. Since water has known weight, we know that a 231 foot long, one-inch square pipe holds 100 pounds of water. At the bottom of the one-inch square pipe we refer to the pressure as 100 pounds per square inch (psi). For any diameter pipe 231 feet high, the pressure will always be 100 psi at the bottom. Refer to Figure 8-F.

FIGURE 8-F
Figure 8-F illustrates the relationship between head and pressure.

Head is usually expressed in feet and refers to the height, or elevation, of the column of water. In Figure 8-F we see that a column of water 231 feet high creates a pressure reading of 100 psi. That same column of water is referred to as having 231 feet of **head**. Thus, for water, 231 feet of head is equivalent to 100 psi. Or, 2.31 feet of head equals 1 psi.

It should be noted that head and pressure readings for non-flowing water depend on the elevation of the water and not on the volume of water nor the size or length of piping.

Flow and Friction Loss

Flow is measured as the volume of water moved over a given length of time. This is generally referred to as gallons per minute (gpm) for larger flows and gallons per hour (gph) for smaller flows. When water moves through a pipe, it must overcome resistance to flow caused by friction as it moves along the walls of the pipe as well as resistance caused by its own turbulence. Added together, these losses are referred to as **friction losses** and may significantly reduce system pressure.

Figure 8-G illustrates the relationship of flow and friction loss. For any flow through a level pipe the gauge pressure at the pipe inlet will be greater than the gauge pressure at the pipe outlet. The difference is attributed to friction losses caused by the pipe itself and by fittings.

In general, friction losses occur or are increased under the following conditions:

1. Friction losses result from flow through any size or length of pipe (Figure 8-G).
2. Friction losses increase as the flow rate increases or as the pipe size decreases (if the flow rate doubles for a given pipe size, friction losses quadruple, Figure 8-G).
3. Friction losses increase with the addition of valves and fittings to the system (Figure 8-G).

FIGURE 8-G
As shown in these illustrations friction losses increase with additional flow

Power is required to push water to a higher elevation, to increase outlet pressure, to increase flow rates, and to overcome friction losses. Good system design and common sense indicate that friction losses should be minimized whenever possible. The costs of larger pumps, bigger motors, and increased power consumption to overcome friction losses must be balanced against the increased cost of larger, but more efficient, system piping. In either case, unnecessary valves and fittings should be eliminated wherever possible.

Submersible Pumps vs. Jet Pumps

Submersible and jet pumps are both used in domestic groundwater systems. When high flow rates and pressure settings are required at high operating efficiencies, submersible pumps are generally preferred. Submersible pumps have the advantage of performing well both in shallow well applications as well as at depths to 2,000 feet. An extensive range of submersible pump models is also available allowing a precise match to exact system requirements.

Convertible jet pumps are sometimes an economical alternative to submersibles, especially in shallow well installations of 25 feet or less. The pumps are less expensive, installation is simplified, and they are easily converted for deep well installations down to 100 feet (Figure 8-H).

In “weak” well applications where the pump lowers the water level in the well faster than the well can replenish itself, a deep well jet pump with a tail pipe is particularly effective when flow requirements are relatively small. By adding 35 feet of tail pipe below the jet assembly with the foot valve attached to the bottom, it will not be possible to pull the well down and allow air to enter the system. Pump delivery remains at 100% of the rated capacity down to the level of the jet assembly. If the water level falls below that point, flow decreases in proportion to the drawdown as shown in Figure 8-I. When pump delivery equals well inflow, the water level remains constant until the pump shuts off. At 33.9 feet of drawdown the pump will no longer deliver water but the foot valve will remain fully submerged.

FIGURE 8-H
Figure 8-H illustrates a convertible jet pump set for deep well use (to 100 feet).

Final Pump Selection

Final pump selection will depend upon specific application requirements and cost considerations. Regardless of the pump type, system flow and head requirements (discussed in detail in Part 2) must be determined prior to actual pump selection.

Flow requirement will be determined by the size of the house or farm (including the number of bathrooms, outlets and appliances), the size of family, and the number of farm animals, if applicable.

Total Pumping Head must be calculated to ensure that the pump selected will meet all head or discharge pressure requirements. Total pumping head is the combination of the total suction lift (or lift in well), plus the pump discharge head (consisting of the elevation from the pumping water level to pressure tank plus pressure tank discharge pressure), plus all system friction losses.

Total Dynamic Head is equivalent to total pumping head plus velocity head. In most residential systems, velocity head is negligible. Because of this, the velocity head term has been left out of future examples and formulas. From the information gathered on flow and head requirements, a specific submersible or jet pump may be selected and an appropriately sized pressure tank ordered.

FIGURE 8-I
Figure 8-I illustrates the use of a tail pipe on a deep well convertible jet pump to compensate for weak well conditions.

PART 2: CABLE SELECTION

Submersible Pump Cable Selection Charts (60 Hz)

CABLE LENGTH SELECTION TABLES

The following table (Table 8-Q(2)) lists the recommended copper cable sizes and various cable lengths for submersible pump motors. Proper wire size will ensure that adequate voltage will be supplied to the motor.

This table complies with the 1978 edition of the National Electric Table 310-16, Column 2 for 75°C wire. The ampacities (current carrying properties of a conductor) have been divided by 1.25 per the N.E.C., Article 430-22, for motor branch circuits based on motor amps at rated horsepower.

To assure adequate starting torque, the maximum cable lengths are calculated to maintain 95% of the service entrance voltage at the motor when the motor is running at maximum nameplate amps. Cable sizes larger than specified may always be used and will reduce power usage.

The use of cables smaller than the recommended sizes will void the warranty. Smaller cable sizes will cause reduced starting torque and poor motor operation.

CALCULATING MIXED CABLE SIZES

In a submersible pump installation any combination of cable sizes may be used as long as the total percentage length of the individual cables does not exceed 100%. Mixed cable sizes are most often encountered when a pump is being replaced with a larger horsepower model and part of the old cable will be left in place.

In the following example, a 2 HP, 230 volt, 1 phase pump is being installed to replace a smaller model. The 115 feet of buried #12 cable located between the service entrance and the well head will be used in the replacement installation. The well driller must be able to calculate the required size of cable in the well to connect the new motor at a setting of 270 feet.

Cable Size Calculation:

Step 1—Check Table 8-Q(2) to see if the 115 feet of existing #12 cable is large enough to provide current to the larger 2 HP replacement pump. The table tells us that #12 cable is adequate for a maximum length of 250 feet.

FIGURE 8-Q(1)
Example of Mixed Cable Installation

Step 2—Since 250 feet is the maximum allowable cable length for the #12 cable, calculate the percent used by the 115-foot run. ($115 \text{ ft.} \div 250 \text{ ft.} = 46\%$)

Step 3—With 46% of the total allowable cable used between the service entrance and the well head, 54% remains for use in the well ($100\% - 46\% = 54\%$). Therefore, the 270 feet of cable required in the well can utilize only 54% of the total feet allowed in the table.

Step 4—From Table 8-Q(2) determine the proper size cable required for the 2 HP pump set at 270 feet. (Remember, you are limited to 54% of the length listed in the table.) A check of #10 cable at 2 HP indicates that only 210 feet of this cable could be used ($390 \text{ ft.} \times 54\% = 210 \text{ ft.}$). Since this is less than the 270 required, the next larger size should be tried. For #8 cable, 54% of 620 feet = 335 feet. **The #8 cable is suitable for use in the well at a pump setting of 270 feet.**

See Chart 8-Q(2) next page.

75							1060	1600	1970	2380	2890	3290		

CAUTION: Use of wire size smaller than listed will void warranty.

- Notes:**
1. If aluminum conductor is used, multiply lengths by 0.5 Maximum allowable length of aluminum is considerably shorter than copper wire of same size.
 2. The portion of the total cable which is between the service entrance and a 3ø motor starter should not exceed 25% of the total maximum length to assure reliable starter operation. Single-phase control boxes may be connected at any point of the total cable length.
 3. Cables #14 to #0000 are AWG sizes, and 250 to 300 are MCM sizes.

PART 3: MISC. TECHNICAL DATA, FORMULAS, AND CONVERSION

Calculating Discharge Rate by Using The Horizontal Open Discharge Method

The most reliable method of measuring flow is to use a flow meter. When a flow meter is not available, however, it is possible to estimate the discharge capacity by constructing an "L" shaped measuring stick similar to that shown in Figure 8-V. With the water flowing from the pipe, place the long end of the "L" on top of the pipe. Position the "L" so that the end of the short 4-inch side just touches the stream of water as the stream slants downward. Note the horizontal distance "X" from this point to the open end of the discharge pipe. With the value "X" and the nominal inside diameter of the pipe, use Table 8-X to find the discharge rate in gallons per minute.

EXAMPLE: Horizontal distance "X" is measured to be 12 inches. The size of the pipe is known to be 1½" (nominal diameter). Find 12 inches in the left hand column of the chart and move across to the 1½" pipe size column. Table 8-X indicates that the discharge rate is 40.0 gallons per minute.

Calculating Low Capacity Outlets: A simple procedure for measuring low capacity outlets such as small pump outlets, hose spigots, and faucets is to record the amount of time it takes to fill a container of known size.

EXAMPLE: Select a container of known size such as a 5-gallon paint bucket. With a watch, measure, in seconds, the amount of time it takes to fill the bucket. If it takes 30 seconds to fill a 5-gallon bucket, Table 8-W indicates that the flow is 10.0 gallons per minute. To obtain gallons per hour (gph) multiply 10.0 x 60 to obtain 600 gph.

TABLE 8-W

Discharge Rate in Gallons Per Minute (GPM) for Low Capacity Systems

Capacity of Container (Gallons)	Time (in seconds) to Fill Container							
	10	15	20	30	45	60	90	120
Discharge Rate in Gallons Per Minute (GPM)								
1	6.0	4.0	3.0	2.0	1.3	1.0	.7	.5
3	18.0	12.0	9.0	6.0	4.0	3.0	2.0	1.5
5	30.0	20.0	15.0	10.0	6.7	5.0	3.3	2.5
10	60.0	40.0	30.0	20.0	13.3	10.0	6.7	5.0

NOTE: Multiply gallons per minute (GPM) by 60 to obtain gallons per hour (GPH).

Calculating Distance to Water Level

Install ½" or ¼" pipe or tubing into the well so that the end of the tubing extends 10 to 20 feet below the lowest possible pumping water level. Be sure that all joints in the tubing are airtight. As the tubing is lowered into the well measure its length. Record the measurement.

TABLE 8-X

Discharge Rate in Gallons Per Minute (GPM) for Large Capacity Systems

Horiz. Dist. (X) Inches	Nominal Pipe Size (in Inches)									
	1	1 ¼"	1 ½"	2"	2 ½"	3"	4"	5"	6"	8"
Discharge Rate in Gallons Per Minute (GPM)

19				100.0	148	232	395	620	910	1580
20					156	244	415	650	950	1660
21						256	435	685	1000	1750

Once the tubing is fixed in a stationary position at the top of the well, connect an air line and pressure gauge. With a tire pump or other air supply, pump air into the line until the pressure gauge reaches a point where it doesn't read any higher. Record the pressure gauge reading at this point.

Figure 8-Y illustrates a typical method for measuring distance to water level:

X = Distance to water level (in feet). This figure to be determined.

Y = Total length of air line (in feet).

Z = Length of submerged air line. This value is obtained from the pressure gauge reading which reads in pounds per square inch (psi). Multiply the pressure gauge reading by 2.31 to obtain the length of the submerged air line in feet.

Distance to water level (X) = (Y) - (Z)

= The total length of the air line (Y) minus the length of the submerged portion of the air line (Z).

Figure 8-Y

Calculating the distance to water level.

FORMULAS

TEMPERATURE CONVERSIONS:

$$\text{Degrees C} = \frac{5}{9} \times (\text{Degrees F} - 32)$$

$$\text{Degrees F} = \left(\frac{9}{5} \times \text{Degrees C} \right) + 32$$

Area of a Circle:

$$\text{Area} = \pi r^2$$

Circumference of a Circle:

$$\text{Circumference} = 2 \pi r$$

$$r = \text{radius}$$

$$\pi = 3.14$$

Volume of a Tank or Cistern:

$$3.14 \times (\text{radius of tank})^2 \times (\text{ht. of tank}) \times 7.48 = \text{Gallons}$$

Radius and height of tank measured in feet

7.48 = number of gallons per cubic foot of water

WORK, POWER, AND EFFICIENCY:

The amount of work required to lift 1 pound to a height of 1 foot is defined as 1 ft.-lb. To lift 100 pounds to a height of 60 feet is 100 pounds x 60 feet = 6,000 ft.-lbs. This amount of energy remains the same whether it takes one minute or one hour to lift the weight. The rate of working, however, is referred to as **power** and was 6,000 ft.-lbs. per minute in the first case and 100 foot pounds per minute in the second case.

Power can be represented either mechanically or electrically. **Mechanical power** is measured in horsepower (HP). One HP is the theoretical power required to raise 33,000 pounds to a height of one foot in one minute, or:

$$\begin{aligned} 1 \text{ HP} &= 33,000 \text{ ft.-lb./minute} \\ &= 550 \text{ ft.-lb./second} \end{aligned}$$

Electrical power is measured in watts(w) or kilowatts(kw), and:

$$1,000 \text{ w} = 1 \text{ kw} = 1.34 \text{ hp, or}$$

$$1 \text{ HP} = 745 \text{ w} = 0.746 \text{ kw}$$

WATER HORSEPOWER (WHP):

Water horsepower is the power required to raise water at a specified rate against a specified head, assuming 100% efficiency.

$$\text{WHP} = \frac{\text{GPM} \times \text{Total Pumping Head}}{3,960}$$

BRAKE HORSEPOWER (BHP):

Brake horsepower is based on test data and can be either the horsepower developed at the motor shaft (motor output) or that absorbed at the pump shaft (pump input).

$$\begin{aligned} \text{Pump BHP} &= \frac{\text{WHP} \times 100}{\text{Pump Efficiency} (\%)} \\ &= \frac{\text{GPM} \times \text{Total Pumping Head} \times 100}{3,960 \times \text{Pump Efficiency} (\%)} \end{aligned}$$

$$\text{Motor BHP} = \frac{\text{Power input} \times \text{Motor Efficiency} (\%)}{100}$$

$$= \frac{1.34 \times \text{kw input} \times \text{Motor Efficiency} (\%)}{100}$$

PUMP EFFICIENCY:

Pumps and motors, like all machines, are not 100% efficient. Not all of the energy supplied to them is converted into useful work. Pump efficiency is the ratio of power output to power input, or:

$$\text{Efficiency} (\%) = \frac{\text{Power Output} \times 100}{\text{Power Input}}$$

$$\text{Pump Eff.} (\%) = \frac{\text{WHP} \times 100}{\text{Pump BHP (Input)}}$$

$$= \frac{\text{GPM} \times \text{Total Pumping Head} \times 100}{3960 \times \text{Pump BHP (Input)}}$$

$$\text{Motor Eff.} (\%) = \frac{\text{Motor BHP (Output)} \times 100}{1.34 \times \text{kw input}}$$

$$\text{Plant Eff.} (\%) = \frac{\text{GPM} \times \text{Total Pumping Head} \times 100}{5,300 \times \text{kw Input}}$$

ELECTRIC POWER (AC):

E = Electrical pressure (volts). Similar to hydraulic head.

I = Electrical current (amps). Similar to rate of flow.

$$\text{W} = \text{Electrical power (watts)} = E \times I \times \text{PF}$$

kw = Kilowatt (1,000 watts)

kw-hr. = Kilowatt-hour = 1,000 watts for one hour

Apparent Power = $E \times I$ = volt-amperes

PF = Power Factor = Useful Power ÷ Apparent Power

Power Calculations for Single-Phase Power

$$\text{W (Watts)} = E \times I \times \text{PF}$$

NOTE: When measuring single-phase power use a single-phase wattmeter.

$$\text{Input HP to motor} = \text{W} \div 746 = 1.34 \times \text{kw}$$

Power Calculations for Three-Phase Power

$$\text{W (Watts)} = 1.73 \times E \times I \times \text{PF}$$

Where: **E** = effective (RMS) voltage between phases

I = average current in each phase

NOTE: When measuring three-phase power use either (1) three-phase wattmeter, (2) single-phase wattmeters, or the power company's revolving disc wattmeter.

When calculating power with a revolving disc wattmeter use the following formulas:

$$\text{kw input} = \frac{\text{K} \times \text{R} \times 3.60}{t}$$

$$\begin{aligned} \text{Input HP (to motor)} &= \frac{\text{K} \times \text{R} \times 3,600}{746 \times t} \\ &= \frac{\text{K} \times \text{R} \times 4.83}{t} \end{aligned}$$

FORMULAS

$$\text{Motor BHP (output)} = \frac{\text{Input HP} \times \text{Motor Eff.(\%)}}{100}$$

Where K = Meter constant = watts per revolution of revolving disc (value of K is marked on the meter nameplate or on the revolving disc). Where current transformers are used, multiply meter constant by current transformer ratio.

R = Number of disc revolutions counted.

t = Time in seconds for R revolutions.

CALCULATING OPERATING COSTS OF PUMPS:

Costs in Cents per 1,000 Gallons:

$$\text{Cost (¢)} = \frac{\text{kw Input} \times r \times 1,000}{\text{GPH}}$$

Cost in Cents per Acre-Inch

$$\text{Cost (¢)} = \frac{\text{kw Input} \times r \times 452.6}{\text{GPM}}$$

Where: r = cost of power in cents per kw-hr.

FRICITION LOSS TABLES

NOTES:

Based on schedule 40 steel and plastic fittings.

Figures given are friction losses in terms of Equivalent Lengths of straight pipe.

① Friction loss figures are for screwed valves and are based on equivalent lengths of steel pipe.

CONVERSION TABLES
